Re.: Atlas of Genetics and Cytogenetics in Oncology and Haematology

To whom it may concern

I would like to express strong support for Dr. Jean-Loup Huret's efforts to maintain the *Atlas of Genetics and Cytogenetics in Oncology and Haematology*. This systematic collection of cytogenetic and genetic aberrations in cancer and leukemia, the molecular genetic outcome of the cytogenetic abnormalities, and the clinical consequences of the genetic changes, has grown into a truly monumental encyclopedic work of great importance to cancer research worldwide. The *Atlas of Genetics and Cytogenetics in Oncology and Haematology* has, in fact, over the years become an invaluable reference and resource for scientists and clinicians involved in cancer research.

The *Atlas of Genetics and Cytogenetics in Oncology and Haematology* was established by Dr. Huret and it is totally dependent on his and his co-worker's dedicated and untiring efforts. The *Atlas* is continuously updated and freely available on the Internet with links to other relevant databases, and Dr. Huret and his colleagues spend considerable time, not only to collect, review, and validate the vast amount of new information, but also to design and develop new software strategies with improved search capabilities, all with the goal to best serve the scientific community.

Sincerely,

Felix Mitelman, MD, PhD, DSc
